📌 HOME BUYER VERDICT

This Mahadevapura flat offers a solid living experience, especially if you value good natural light for most of the year. The neighborhood itself is a mixed bag with a decent overall score of **72/100 (Grade B+)**, but this specific unit shines with an excellent Home Comfort Score of **87/100**, leading to a strong Combined BlindSpot Score of **79/100**. You'll get plenty of sun during the cooler months, which is great for energy and mood, and surprisingly, no direct sun during the hottest summer months, which helps keep things cool.

The main trade-off here is the neighborhood's infrastructure, particularly water, roads, and sewerage, which are weaker points. However, the unit's high floor and south-facing aspect mean you'll enjoy a bright space for a significant portion of the year, making it a comfortable home base. Consider this property if you prioritize a well-lit, comfortable living space and are prepared for potential local infrastructure quirks.

CONSUMER SCORECARD

SUNLIGHT Excellent 7.1h/day avg	ENERGY / COOLING Low risk Moderate summer sun exposure (1.8h/day avg, South-facing).	FAMILY FRIENDLINESS Moderate Schools 75, crime 72	ELDERLY SUITABILITY Fair Floor 15, roads 60, crime 72 — medical proximity not yet mapped	INDOOR PLANTS Good 7.1h/day avg light · air quality 88
WORK-FROM-HOME FIT Inconsistent No light May–Aug	INVESTMENT BAND Upper ₹5,500—₹7,800/sqft		VENTILATION Good Good ventilation potential — floor level supports airflow and wind is steady (avg 16.9 km/h today). (Live forecast + floor-based openness estimate, not a year-round average.)	

PROS

- + Air Quality is excellent (88/100)
- + Strong sun exposure through March/October/February
- + Naturally well shaded — low summer heat gain

CONS

- No direct sun May–August (4 months)

- + Naturally well-shaded — low summer heat gain
- + Good natural ventilation potential

IDEAL FOR

young professionals/singles: who work from home and value natural light and comfort, and are okay with moderate neighborhood infrastructure.

Area-level — the same for every unit in this pincode. Source: Neighbourhood Score.

CRIME

360/yr · safer than 51% of areas

SCHOOLS MAPPED

3 — incl. MTB JNANA JYOTHI VIDYANIKETHAN, EURO SCHOOL WHITEFIELD, BANGALORE, THE BRIGADE SCHOOL AT MAHADEVAPURA

PRICE CONTEXT

₹5,500–₹7,800/sqft

Mahadevapura presents a mixed picture, scoring **72/100** overall. For a young professional, some aspects are quite strong, while others might require a bit more patience. The air quality is a definite plus at **88/100**, meaning you'll breathe cleaner air, which is great for overall health and comfort, especially if you're working from home. Power reliability is also good at **78/100**, reducing worries about outages interrupting your work or daily life. Crime is moderate at **72/100**, making it safer than 51% of comparable areas, so you can feel reasonably secure.

However, the infrastructure has some clear weaknesses. Water supply scores only **52/100**, which is a significant concern for daily living and could mean relying on tankers or facing supply inconsistencies. Roads and sewerage both score **60/100**, suggesting that commutes might be bumpy or slow, and local civic services could be less than ideal. This is important for someone who needs reliable connectivity for work or social life. The price context of ₹5,500–₹7,800 per sq ft places it in the "Upper" band, indicating it's a sought-after area despite these infrastructure challenges, possibly due to its location or other amenities not captured in these scores.

- Young professionals/singles: The strong air quality and power scores are great for WFH, but be aware of the lower scores for water and roads, which could impact daily convenience and commute times.
- Investors: The "Upper" price band of ₹5,500–₹7,800 per sq ft against a composite score of **72/100** suggests a premium for the location, but the weaker water and road infrastructure might be a long-term consideration for renter satisfaction and property appreciation.
- Families with school-age kids: The schools score of **75/100** and moderate crime tier make this a decent option if local education and safety are key, though other infrastructure might still be a factor.

Sun & Shadow Analysis — Floor 15, South-facing

BEST MONTHS

March, October, February

WORST MONTHS

May, June, July

DAILY AVERAGE

7.1h usable sun

FLOOR 15 SPECIFIC ANALYSIS

Unit on Floor 15 (approx. 15' high), with south-facing unit, receives direct sunlight for most of the day.

Living on Floor 15 (around 45m high) with a south-facing unit means you're generally above most typical urban obstructions, giving you excellent access to the sky. This is reflected in the "Overall feasibility: Excellent (avg **7.1h/day** usable)" score. You'll experience a significant variation in direct sunlight throughout the year, which is a key factor for comfort and energy costs.

During the cooler months, from September through March, you'll get fantastic morning sun. For instance, in October, direct sun starts as early as **~06:19**, providing a bright start to your day, and in March, it begins around **~06:36**. These months offer a substantial amount of usable sun, ranging from **10.3h** in September to **11.8h** in March. This is ideal for natural light during your working day, reducing the need for artificial lighting and potentially boosting your mood.

However, things change dramatically in the peak summer months. From May to August, your south-facing unit gets **no direct sun**. April also sees a sharp drop to just **5.5h** of usable sun, starting much later at **~09:36**. While this might sound like a downside, for a young professional working from home, it's actually a huge advantage for managing heat gain. No direct sun means your unit won't bake in the intense summer heat, significantly reducing your cooling load and AC expenses during the hottest part of the year. You'll still get ambient light, but you'll likely need to rely on artificial lighting more during these months, especially in the mornings. The lack of direct sun also means less glare on screens, which is a big plus for productivity.

SOUTH-FACING WINDOW ASSESSMENT

For a south-facing window in Mahadevapura (12.9810°N), the sun's position relative to the equator dictates when you'll get direct light. Bangalore is north of the equator, so the sun's path shifts significantly throughout the year.

From September through March, the sun is in the southern sky (relative to Bangalore) for a good portion of the day. This means your south-facing windows will receive direct sunlight. In the winter months (December, January, February), the sun is at its lowest elevation (**53°** to **63°** at noon) and furthest south, resulting in long hours of direct sun, often starting early in the morning (e.g., **~06:46** in December) and lasting well into the afternoon. This is excellent for natural warmth and light during the cooler parts of the year, making your space feel bright and inviting.

As spring progresses into April, the sun's noon elevation increases dramatically to **84°**, meaning it's almost directly overhead. While you still get some direct sun, it's for fewer hours (**5.5h**) and starts later (**~09:36**) as the sun quickly moves overhead. Then, from May to August, the sun moves north of Bangalore, meaning it's in the northern sky for the entire day. Consequently, your south-facing windows will receive **no direct sun** during these months.

This is a fantastic facing for this location. While you'll miss direct sun in the hottest summer months, this is actually a benefit as it prevents excessive heat gain, keeping your unit cooler and reducing AC costs. You'll still get plenty of ambient light, but without the harsh direct rays. During the rest of the year, especially the cooler months, you'll enjoy abundant direct sunlight, providing natural warmth and brightness. The main consideration is potential glare on screens during the winter and autumn months when the sun is lower and more direct, so good blinds will be essential.

YOUR WEEK IN THIS FLAT

- Desk light window: This unit averages **7.1h/day** of usable sun, providing ample natural light for most of your working day.
- Screen glare risk: Glare risk is higher during peak sun hours, for example, between **09:35–15:15** in January when the sun is lower and more direct.
- AC-heavy months: You'll likely find May, June, July, and August to be AC-heavy months, despite getting no direct sun on this side during that period.
- Privacy from facing units: Data is not available for this address.
- Commute reach: The Roads score of **60/100** indicates potential challenges with road quality and traffic, which could impact commute times.
- Exit in three years: The property is in the "Upper" price band of **₹5,500–₹7,800 per sq ft** with a composite neighborhood score of **72/100**, suggesting it's priced in line with the area's strengths and weaknesses.

Usable Sun Hours by Month

Best months: March, October, February · Worst months: May, June, July

HOW THIS REPORT WAS BUILT

- Neighbourhood factor scores, crime, schools, and price context come from Neighbourhood Score — the same for every unit in this pincode, deterministic, not AI-generated.
- The Combined Score is $(72 \times 50\%) + (87 \times 50\%) = 79$ — a weighted average, not AI-generated.
- Sun position and monthly sunlight hours come from a NOAA solar-geometry algorithm — deterministic, not AI-generated.
- Floor clearance uses a generic urban-obstruction estimate, not a measurement of this property's specific neighboring buildings.
- The narrative sections use AI to interpret the real numbers above and describe the screenshots — it is instructed to treat the figures as fact, not to estimate its own.
- The 12 sun/shadow map screenshots and their per-image analysis are in a separate gallery, linked near the top of this report (and clickable in the downloaded PDF too) — that link works as long as the browser tab this report was generated in stays open; it won't work if reopened later in a new session, since the gallery isn't hosted on a server yet.
